The difference between innerHTML and document.createElement?

The main difference between innerHTML and document.createElement is how they manipulate the HTML content in the DOM:

1. **innerHTML:**

   Purpose: Used to set or retrieve the HTML content within an existing DOM element.

   Example:

   element.**innerHTML** = "<p>New content</p>";

   var content = element.**innerHTML**;

2. **document.createElement:**

   Purpose:

   Creates a new DOM element specified by the tag name without inserting it into the DOM tree.

   Example:

   var newDiv = **document.createElement**("div");

   parentElement.appendChild(newDiv);
